

engineroom floors

Börger is specialist in delivery of engineroom floor systems. Our delivery program comprises design, material package delivery and mounting. Depending on specification and class requirements floors are delivered in steel or aluminium. The floor plating can be bolted or welded and provided with hatches for e.g. valvecontrol.

The floor framing consists of special galvanized system profiles.

These profiles are connected by means of accessories and sliding nuts, creating easy adjustable mounting. The system can also be used in other spaces like bowthruster rooms, separator rooms, wheelhouses, holds etc.

The best fit and time saving.
